

TIMBER REVEALS

What are reveals?

Reveals are the timber liners on the inside of the window. They link the plaster, studs, cavity off the wall, and the cladding system being used. Timber architraves can be fixed to the inside edge of the reveals and for a modern finish square set plaster finish can be used to give a continuous plaster line back to the window frame.

Some typical sizes of the reveals are;

- 135mm for brick veneer with plaster (10mm) stud (90mm) and brick cavity (40mm).
- 100mm for Colorbond and weatherboard cladding with plaster (10mm) stud (90mm) cladding (20mm). **Battens maybe required
- Square set 125 + 2mm gap for brick veneer and 90mm + 2mm gap for most weatherboard applications.

TAS OAK

Tasmanian Oak is a hardwood timber and is used where clear finish is needed (won't be painted). Tas Oak reveals are available up to widths of 185mm.

PRIMED MERANTI

Primed Meranti is used where a paint finish is needed. It comes with a white primed base coat on visible sides. Give the reveals a light sand before painting and it will give you an excellent smooth finish.

Meranti reveals are also used when square set plaster is needed. Primed Meranti reveals are available up to a width of 285mm.

All timber reveals are subject to imperfections, GP Glass is not responsible for sanding or bogging of timber reveals.
